Rapid Deployment Tool 1.1 Release Notes

August 25, 2020

New Features and Enhancements:

- Jamf Integration:
  - Added option to sending a pkg to a distribution point (smb).
  - You can now connect to a Jamf instance to create a package record for the created settings package, and a policy referencing that package, which can be pushed to endpoints. You can also optionally scope the newly created policy to a pre-existing group in Jamf automatically.
- You can now navigate back to the home screen by using the home button. This enables you to move backwards in the workflow without restarting the process.
- You can now save your changes from the **File** menu when on a platform screen, and load from the **File** menu when on the home screen. The changes are stored as a single XML properly list file (.RDT). The certificates and their paths are not saved.
- Added new Privilege Management for Mac .plist settings: **MountMessageNoteSame**, **MountMessageNoteNewer**, and **MountMessageNoteOlder**.

Compatibility:

- Minimum macOS required is 10.15 Catalina
- BeyondInsight Adapter 5.6
- Privilege Management Console SR2 2.4

Notes:
