

# Android SDK 2.2.13 Release Notes

August 13, 2020

## New Features and Enhancements:

- SessionStartException has a new method `getError`, which returns a new `ErrorType` enum value describing the cause of the exception.
- New `BomgarSessionDelegate` callbacks have been added.
  - `sessionReconnectStart`
  - `sessionReconnectSucceeded`
    - When a connection issue causes the client to lose connectivity to an appliance, `sessionReconnectStart` is called instead of `sessionDidDisconnect`. Only after the reconnect attempt fails is `sessionDidDisconnect` called, which is a total connection state reset, with any new session requiring a new connection and authentication.
  - `screenSharingStarted`
  - `screenSharingStopped`
    - These events alert the app to the current screen sharing state that the connected representative has initiated.
- A new `BomgarSession` method, `setPrivacyScreen`, was added.
  - This method can be used to disable the representative from capturing the contents of the screen.

## Issues Resolved:

- To resolve issues with screen sharing failing to capture when moving to a new Activity, removed any calls of `setRunningActivity(null)` from `onPause`.
- Updated the documentation to remove the suggestion to call `setRunningActivity(null)` in the Activity `onPause`.
