

AD Bridge 21.1.1 Release Notes

June 24, 2021

New Features and Enhancements:

- Added a policy file for RHEL8 that enables users to log in using the GUI, reducing errors in the log file.
- The Samba-interop script now validates options when passing in arguments. The help output is displayed if a parameter is passed that it does not recognize.

Issues Resolved:

- Resolved issue in which access control did not resolve groups in child domains.
- Resolved issue with **domainjoin** in which duplicates were present in the status file after upgrades.
- Resolved issue with Solaris in which a double prompt occurred for license evaluation when attempting to change an AD user password.
- Resolved issue in which a misleading error was displayed when **gp-admin** was not run as an AD user.
- Resolved issue with the Operations Dashboard in which a *Null* error displayed on fresh install.
- Resolved issue in which **dbreaper** did not validate whether an interface was enabled when determining which records to reap.
- Resolved issue in which Failed Logon report did not display events.
- Resolved issue in which Logon Activity Report did not filter records.
- Resolved issue in which the cell manager did not check whether a group existed.
- Resolved issue in which password prompts did not work when they were the only policy defined on CentOS.
- Resolved issue in SUSE in which a libcrypto sudoers error occurred.
- Resolved issue with **gpadmin** in which a krb5 error occurred when host names had more than 15 characters.
- Resolved issue with BMC in which the **Date** filter did not work with some reports.
- Resolved issue upgrading from AD Bridge Open to AD Bridge Enterprise that resulted in a broken system when using a repository.

Notes:

- AD Bridge 21.1.1 supports upgrades from 8.8.0, 9.0.2, 10.0.0, 10.1.1, 10.1.2, and 21.1.0.
