

AD Bridge 9.0.1 Release Notes

May 9, 2019

New Features and Enhancements:

- Includes a patch for the RHEL 7.6 nova-api, resolving issues with the latest version of OpenStack and SELinux.
- Added information on how to test mount remotehomedir.
- Modified the group policy setting GPORefresh/GPUupdate to apply always/once.
- Modified the group policy setting Change Monitor to apply once/always. This changes the default behavior for file-based group policies. Policies now reapply if they were changed locally. Change to "Apply once" for the previous behavior.
- Added a Windows tool to locate duplicate UID/GID usage in Active Directory.

Issues Resolved:

- Group policy now supports monitoring of /etc/issue.
- Resolved an issue where a missing user/group override file would break group policy.
- Syslog group policy now re-applies following a gpupdate.
- Auto-mount files are now marked as executable.
- Resolved an issue with several reports generating errors:
 - Accounts with Old Passwords
 - Active Directory accounts with Time or Computer restrictions
 - Disabled Accounts
 - Group List
 - Inactive Computers
 - Inactive Users
 - Inactive Users over 90 Days
 - SUDO GPO Settings
 - Temporary Accounts
 - User List
 - Users with Non-Expiring Passwords
- When an AD user logs in while the domain is offline, the lsass now correctly uses the available cache.
- When a domain is offline, added behavior to enumerate the other online domains to return group membership.
- Resolved a reapsysl regular expression issue.
- Resolved an intermittent double free error when restarting gpagent.
- Added a display label for RSOP eventfw settings.
- Resolved an issue with the scroll bar being cut off on the Cell Properties screen when there were a lot of users.

Notes:

- Removed the activclient package from the rpm installer.
- Renamed PBIS to BeyondTrust AD Bridge.
