Thank you for selecting BeyondTrust PowerBroker. This file contains important information regarding the current version of this product including new features and changes. Further details can be found in the PowerBroker Servers Management Console manual.

This document is current as of the date of publication. The most current version is available from www.beyondtrust.com.

BeyondTrust welcomes your comments and suggestions. Please use the information provided at the end of this file to contact us.

WHAT'S IN THIS FILE

- New Features / Enhancements
- Significant Bug Fixes
- Known Issues
- Additional Information

FIXES in Release 7.1.1

- fixed authentication timing issue

NEW FEATURES in Release 7.1.0

- use hostname for PBUL rest connections if available, otherwise fall back to IP.
- failed rest connections now provide additional feedback in task output
- added content-type header for API

FIXES in Release 7.1.0

- Verify Certificates for PBUL improperly reflected state in settings
- Verify Certificates for PBUL did not trigger save in first-run wizard

- removed Perl dependency from profile script
 - fixed validate SSH fingerprints toggle
 - fixed issue causing deleted hosts to appear in lists and host grids
-

FIXES in Release 7.0.3

- added product name and product version to windows executable
-

FIXES in Release 7.0.2

- product is now disabled by default when installing on appliance
 - fixed routing issue with authentication on appliance
 - default configuration file updated to use correct database extension
 - fixed issue with upgrade removing configuration files on appliance
-

FIXES in Release 7.0.1

- role policy editor allows Run User and Run Host to be set for Reject roles
 - fixed style issue that caused lists of roles to render improperly
-

NEW FEATURES in Release 7.0.0

- BeyondTrust Updater deployment available in BeyondTrust UVM environments
 - managed PowerBroker software can be delivered via BeyondTrust Updater in UVM environments
 - managed software location is now configurable
 - Powerbroker for Unix and Linux encryption and REST keys location changed to ensure write permission
 - Microsoft SQL Server is a supported database
 - added silent mode installation option for Windows
 - added disabled configuration option to prevent application from running
-

ENHANCEMENTS in Release 7.0.0

- deleted usernames can be re-used
 - added graceful handling in scenarios when server data is not available
 - client side email validation improved
-

FIXES in Release 7.0.0

- deployment of readme and EULA fixed in Debian release
- Active Directory search is now case neutral

- added error handling when retrieving Sudo Aliases via REST
- fixed Windows installer security vulnerability
- fixed RPM reporting failure after successful installation in some environment
- numerous style and icon bugs fixed

KNOWN ISSUES in Release 7.0.0

- An existing error in the PowerBroker Servers Management Console installers will remove PowerBroker Unix and Linux encryption and REST keys from the console during an upgrade. The PowerBrokerUnix and Linux deployment will **not** be affected, however the local keys will need to be re-obtained and re-deployed in the console. To do so, move the keys to a safe location before upgrading, then

use the Settings/ Integration page to re-deploy the keys.

- Database changes and ORM updates require that the PBSMC must be upgraded from 6.1 to 7.0; earlier versions of the product cannot be updated directly to 7.0 and instead must be first upgraded to 6.1.
